FOREWORD

The National Statistics Bureau (NSB) is pleased to present the Dzongkhag Population Projections 2017-2027 based on the 2017 Population and Housing Census of Bhutan (PHCB).

Population projection is one of the main statistical data that provides an estimate of a future population, which is critical for planning and policy formulation. It is widely used by policy makers, planners, researchers, and academia and alike. Population projections serve as a basis for planning and determining future demands for essential services such as jobs, housing, roads and transportation, communication, education and health facilities etc.

This report supersedes the earlier population projections (2005-2015) and provides an updated and revised population figures. It contains the results of the population projections that provide population sizes, by sex and age group for each single year from 2017 to 2027. The results are presented in tabular and graphic formats supplemented by explanations on how the exercise was carried out.

Projections of future size and age structure of population are based on assumptions about the future levels of fertility, mortality, and migration. The baseline population by age and sex and likely changes in the levels of fertility, mortality, and migration project future changes in the population size and its age-sex structure

We remain hopeful that the Ministries, Departments, Agencies, development partners, individuals, researchers, academia, civil society organizations and the public in general would find the report useful and informative.

ChhimeTshering
Director
National Statistics Bureau

ACKNOWLEDGEMENT

Section 1
Dzongkhag Population Projections

1.1 Introduction

National Statistics Bureau (NSB) conducted the second Population and Housing Census of Bhutan (PHCB) in 2017. The 2017 PHCB provides useful data to inform evidence-based policy making and plan formulation. It also presents relevant socio-demographic and economic as well as the service delivery related indicators, which are useful in measuring progress towards achievement of the key government targets. More specifically, the 2017 PHCB collected information on the demographic characteristic of Bhutanese population, education, health, labour and employment, migration, housing, household amenities, food sufficiency and household asset ownership, which are useful to understand current status as well as the trends.

For planning and ascertaining the future needs, it is important to know future size of the population both at national and sub-national levels. In view of this, a need to carry out projections by using the results of 2017 PHCB and other most recent data on demographic parameters applying robust and scientific demographic techniques of population projections was keenly felt.

The NSB, with technical support from UNFPA, prepared the population projections at the national levels as well as for the 20 Dzongkhags for a period of 30-years. Since the reference period of 2017 PHCB is 30th May, the projected population makes reference to the same reference period for future years. The population projections report at the national level presents the projected populations by age-sex distributions up to 2047 at the national level and projected total populations for each Dzongkhag. The Population Projections-Dzongkhag (2017-2027) report will provide detailed findings of the sub-national level population projections till 2027.

1

1.2 Importance of Data for Local Planning

Projection of population into the future is valuable for the purposes of planning, particularly at the local level of administration. Projections provide population size and its age-sex structure at varying points in time, which is essential for planning and administrative purposes. Population projections are useful in assessing future requirements for housing, food, infrastructure and various other amenities as well as provision of various services such as health and educational services. Projection of population by working age groups gives an estimate of potential labour force and facilitates planning at the local level. This also gives an understanding of the prospects of drawing the demographic dividend and the period during which the window of demographic opportunity is likely to remain open.

With the strong decentralization policy in place, detailed information on population characteristics at the local level about is necessary. It helps the policy makers and planners in formulating effective developmental strategies for improving the living conditions and overall quality of life of the people. The information on future population dynamics at Dzongkhag level will facilitate the policy makers and planners in understanding the levels and trends in population change.

1.3 Base Data on Population

Bhutan has conducted Population and Housing Censuses (PHCB) in 2005 and 2017. The census reports present details on enumerated population by age-sex composition, its geographic distribution, migration streams, and population size by Dzongkhag. The latest round of the census (2017 PHCB) provides base data on the size and age-sex distribution at the Dzongkhag level as well as many other demographic characteristics of the population. The population projection exercise used data on age and sex composition of the population of each Dzongkhag as the inputs. Moreover, the change in shares of Dzongkhag population from 2005 to 2017 was used to extrapolate the shares of Dzongkhags for projections.

1.4 Population Projections at National Level

Using 2017 PHCB as the base, population projections at the national level have been prepared. The national population projections report provides details on the future size of the population by sex as well as various age groups at the reference point in future years. In addition, it also provides population composition separately for rural and urban areas in future years. The results of the

population projections at the national level were used to project Dzongkhag level population projections following the standard approach used for sub-national projections.

1.5 Methodology for Projections at the Dzongkhag level

Population projection is a scientific exercise and it requires information on various demographic parameters of both present as well as their recent past trends. It requires collating information on baseline population by its age-sex distribution, fertility, mortality, sex ratio at birth, and migration together with the information of such demographic parameters from the recent past.

The cohort-component method is the standard procedure applied to national population projections. This method projects the components of population change such as the births, deaths, and migration in future time periods by age and sex. This entails projection of fertility, mortality and net migration rates in future. It is generally not possible to apply the cohort-component method for sub-national projections because of the unavailability of reliable estimates of various parameters at the smaller regions. The share of sub-national (Dzongkhag) population is thus projected based on recent trends applied to the national projection using the cohort-component method, which gives the total projected populations of Dzongkhags.

Generally, the natural rate of increase as well as the internal migration varies across Dzongkhags. As a result some of the Dzongkhags grow more rapidly than the other and hence the shares of regions change over time. Normally, on the assumption that the trend based on recent changes in the shares of various regions would continue in the near future, the shares are extrapolated over the projection period. In this manner, the shares of Dzongkhags were extrapolated up to 2027 on the basis of the changes observed between 2005 and 2017. However, an assessment of the changes in the shares of Dzongkhags between 2005 and 2017 showed that some of the declines in populations of certain regions were due to phasing out of major infrastructure projects; such trends were abnormal and not likely to continue in the future. Therefore, the extrapolated shares were re-examined and the projected shares were adjusted after taking into account the judgments of experts. These shares have been used in the projections of Dzongkhag populations.

The ratio method is applied to obtain the age-sex distributions of Dzongkhags over the projected period. Raking is applied to ensure

3

that the totals of projected populations in Dzongkhags in various sex and age groups are consistent with the totals for these groups at the national level. Further, the Urban Rural Growth Difference (URGD) model has been used to project percent urban populations in the Dzongkhags over the projection period and the urban and rural populations were obtained.

For projections of rural and urban populations at the national level, the method of urban-rural growth difference (URGD), which is the difference between urban and rural growth rates was adopted in projecting the share of urban and rural populations over the projection period. These shares are applied to the total projected population to obtain rural and urban projected populations at the national level. The age-sex distribution of the rural and urban populations is then estimated following standard methods, which formed the basis of projecting Dzongkhag population by place of residence.

The detailed results were derived at five year intervals for 2022, 2027, 2032, 2037, 2042, 2047 and for single year interval the results were presented till 2027.

1.6 Limitation of Population Projection Results

The national projections are carried out using the cohort-component method which takes into account the levels of fertility and mortality. The assumption of negligible international migrations, which seems to be quite realistic for Bhutan, is made. The estimates of base level parameters are obtained after careful assessment of data and these are projected on the basis of recent and global trends. Therefore, one has a good deal of confidence in the national projections. However, the sub-national projections do not follow such a rigorous procedure due to the non- availability of reliable estimates of various parameters. In the projection shares, the effects of inter-regional variations in the natural rate of increase and inter-regional migration are accounted for only indirectly. The extrapolation of shares of regions assumes that the pattern of recent variations in growth would persist. Moreover, these shares are adjusted by judgment. The pattern of change in regional shares could conceivably change over time and the adjustments made by judgment may not be accurate since the development process in the future may differ in scope and location than in the past. This is a limitation on the projections of Dzongkhag shares as well as in the projection of urbanisation. Besides, the application of the ratio method is also on assumptions on constancy of ratios. These

limitations need to be kept in mind while using the projections at the Dzongkhag level.
