

**STANDARDIZATION OF MEASUREMENT
UNIT SURVEY, BHUTAN
2002**

**CENTRAL STATISTICAL ORGANIZATION
PLANNING COMMISSION**

FOREWARD

The Central Statistical Organization (CSO), Planning Commission with the support of the Asian Development Bank, conducted a survey to standardize measurement units in the country. The need for such a study was realised when a study on household income and expenditure was conducted in 2000 and it was found that the units of measurements for household consumer goods, in most cases, were local traditional measurements, which are not consistent with the International System of Units (SI). This posed considerable problems whenever any quantitative analysis had to be carried out and hence the need for the conversion of local measurement units to SI.

The results of the study will not only be useful to the agencies and individual users to carry out proper analysis, involving quantitative conversion of local units to SI units in particular but will also provide a bench mark to study the trends of its usage by the general public. We are confident that various organizations of the Royal Government, private sector, international agencies and individual researchers at large will find the results informative and useful. The conversion of local measurement units to SI not only brings about standardization of measurement units but will also allow for comparison both at the national and international level.

This survey would not have been possible without the support of ADB for which, we sincerely thank and appreciate. We also wish to place on record our deepest appreciation for the hard work and commitment of the CSO officials for the successful implementation of this survey. Finally, the CSO would appreciate valuable comments and suggestions from the users for the ultimate improvement of the quality of reports in future.

Dewangji
Secretary
Planning Commission

PART I: PRESENTATION OF SURVEY METHODOLOGY

1.1 Background

The survey on standardization of measurement units is the first of its kind initiated by the CSO and funded by the ADB through its TA 3669: "Strengthening of National Statistical System." The Ministry of Agriculture had collected information on the use of the local units used to measuring cereals for transaction in each Dzongkhag. However, these units of measurement were not uniform. The evidences from the pilot survey on Household Income and Expenditure Survey 2000 showed that a large proportion of the rural population use local traditional units for their daily transaction. This survey is an attempt to record all commonly used traditional measurement instruments that are used for transactions of consumer goods. Consumer goods include both agricultural and non-agriculture products like cereals, vegetables, fruits, tobacco, spices, and other related products, diary products and meat, and alcohol and beverages. Due to the non-standardization of the local units reports on consumption and production for the country has been very difficult and sometimes very misleading. Further, the problem was most visible while trying to analyse the consumption pattern by quantity. This survey would in a way also provide the total list of different local traditional units (measuring instruments) in various Dzongkhags, which are most commonly being used at this juncture. This survey was intended to mitigate such problems and as well facilitate conversion among local units and approximation of each local unit to SI units.

1.2 Objectives

Through this survey the CSO will examine and attempt to standardize the local units by converting to the International System of Unit (SI Unit). All the local units will be converted into SI units, which will not only allow comparability at the International level but also allow conversion of quantities into monetary forms, measure the production values; that will be an input to national economic analysis. The conversion table generated from the survey will be widely circulated to all the user agencies in the country.

1.3 Coverage and Methodology

The survey covered 18 Dzongkhags (18 urban centers and 55 geogs). Two Dzongkhags, Samdrup Jongkhar and Sarpang were not covered due to

security reasons. All the Dzongkhag headquarters were treated as urban centers and 55 geogs were selected thorough purposive sampling method after thorough verification from the Dzongkhag sectoral officials and the gups, depending on the common knowledge about the usage of the local units. The samples were selected in such a way that no two adjacent geogs were selected. The survey was conducted at the geog level. Minimum sample of three geogs from each Dzongkhag were enumerated.

1.4 Questionnaire

A questionnaire was developed with the names of all the possible local units, which were in use in the past. The whole questionnaire was divided into eight blocks as follows:-

- Block 1: Cereals, Cereal Preparations and Pulses.
- Block 2: Vegetables
- Block 3: Fruits
- Block 4: Tobacco and Other Products
- Block 5: Oil, Alcoholic and Other Beverages
- Block 6: Dairy Products and Meat
- Block 7: Spices
- Block 8: Miscellaneous

1.5 Approach

The visiting team met the Gups, mangaps, chupens to collect information about the commonly used local units within the geog. As a standard measure; a sample of three existing measuring instrument of different sizes were selected. All items were then measured in the three units. The enumerators actually measured every reported item with the common local unit and then the same amounts of goods were measured using the SI unit. Depending on the names of the local units the team collected weights for three different sizes (smallest, medium and largest) for all reported items.

1.6 Training and Field operation

A total of three teams composed of four members each visited the Dzongkhags. During the training thorough discussions were held on the

purpose and the methodology of the survey. Detailed review of each item under different blocks along with practice in filling up the questionnaire was carried out. The supervisors were instructed to observe ongoing interviews and carry out the field edits. The survey was conducted during the peak winter month of February 2002.

The survey team members were trained to measure and estimate the weights of the items under each block. As a standard rule, for every local unit reported three weights depending on the physical verification of the sizes (smallest, Medium, Largest) was made mandatory. If for instance only one size is standard then the same weight was repeated two times. A detailed instruction to fill-up the form is annexed (Annexure).

1.7 Presentation of results

The survey result is presented at two levels: National and Dzongkhag. The conversion rates from traditional measuring instrument to the SI unit at the national level are the average of the Dzongkhag averages. A detail and reliable estimates are presented at the Dzongkhag level. It is logical to present at the Dzongkhag level since the local measurement units in use are known by different names from one Dzongkhag to another Dzongkhag. It is observed that the average weights measured by a particular measuring local unit known by the same name like *Gasekhalo*, *Chandre* etc differ in conversion rate from one Dzongkhag to another significantly. In order not to misguide and confuse the user and also to retain the uniqueness of the local units to the localities the results are presented at the Dzongkhag level with respective items. All the weights presented have been converted to SI unit (i.e. grams and liters) from local units.

In the urban areas the use of local units for daily transaction with respect to cereal and cereal products are quite negligible because most use standard instruments as kg for weights and metres/feet for length. However, there are instances like the use of bundles for leafy vegetables, *Plate* and *Bangchu* for dried vegetables, *Dre/Khaw* in measuring some miscellaneous items like locally made tea leaves and "Tsangzay". In the rural areas the usage of Standard International (SI) measuring units are limited.

PART II: PRESENTATION OF THE SURVEY RESULT AT NATIONAL LEVEL

CAUTION

The average conversion rates presented at the nation level are the average of the Dzongkhag averages. The conversion rates for different Dzongkhags not only differ significantly for a particularly local unit like *Gasekhalo*, *Chandre Phita* etc; but the traditionally accepted measuring instruments also vary quite significantly. As a matter of fact, the conversion rates at the national level must be used with real good care for meaningful interpretation.

2.1 Presentation of the national conversion rates

The conversion rates table for the national level is presented in four different groupings. The grouping is made based on the items under separate blocks. This was necessary to indicate distinctly the local measuring units used for particular types of crops/items. The first group contains the conversion information for cereal, cereal preparations and the pulses collected under block I. The second group for the vegetable related items collected under block II, third group for items covered under block III to block VI and the fourth group for those items under block VII and block VIII. The survey indicated more than twenty-five different local units still being used at various instances for the transaction of cereals and cereal products (Block I) alone. The various types of local units are as follows:- *Gasekhalo*, *Chandre*, *Badre*, *Khaw*, *Pathi*, *Phita/Lamshu*, *Dre*, *Wongbray*, *Bray*, *Mana*, *Drechu*, *Dhudre*, *Thodre*, *Chethra*, *Zangdre*, *Ngesadre*, *Tsongdre*, *Padre*, *Drupjay*, *Chapjay*, *Zobjay*, *Shinjey*, *Matidre*, *Thimje* etc.

(Note: In this report the word local Unit and Local Measurement Instrument are used interchangeably. The indigenous/local units names are shown in italic in the report and the use of local names of the items inside the tables are also indicated in italic word. Star () marks inside the table indicate that the items do not use the specified local unit.)**

Table 1: Presents the summary of different local units used for measuring cereal and cereal preparations and pulses by Dzongkhag.

Thimphu	Paro	Haa	Chukha	Punakha	Gasa
Gasekhalo	Gasekhalo	Phita	Chandre	Gasekhalo	Gasekhalo
Chandre	Chandre	Drupjay	Pathi	Chandre	Phita
Phita	Phita	Chapjay	Pathi	Phita	Zangdre
Dre	Dre	Matidre	Dre	Thodre	Ngesadre
Padre	Bray		Khaw	Bangchu	Tsongdre
Drupjay	Zobjay		Bray		Bangchu
Zobjay	Shinjay		Padre		
Shinjay	Bangchu				
Bangchu					
Wangdue	Bumthu	Trongsa	Zhemgang	Lhuentse	Mongar
Gasekhalo	Gasekhalo	Gasekhalo	Gasekhalo	Gasekhalo	Gasekhalo
Chandre	Chandre	Chandre	Chandre	Chandre	Chandre
Badre	Phita	Phita	Badre	Khaw	Khaw
Phita	Chethre	Chethre	Dre	Lamshu	Lamshu
Dre	Bangchu	Bangchu	Bangchu		
Trashigang	T/Yangtse	P/gatshel	Samtse	Tsrang	Dagana
Gasekhalo	Gasekhalo	Gasekhalo	Gasekhalo	Khaw	Gasekhalo
Chandre	Chandre	Khaw	Khaw	Pathi	Badre
Khaw	Khaw	Lamshu	Mana	Mana	Pathi
Lamshu	Lamshu	Bangchu	Thodre	Dre	Dre
Bray	Wongbray		Paila	Mana	Mana
				Thodre	Thodre

From table 1, it could be noticed that Gasekhalo, Chandre and Phita/Lamshu are instruments used for measuring cereals/products in all the Dzongkhag except for a few that uses instruments different from the rest.

Table 2: Presents the conversion rates for the cereals and pulses items at the National Level in grams.

PART IV: PRESENTATION OF RESULT FOR THE BLOCK II TO BLOCK VIII BY DZONGKHAG.

Block II:- Most of vegetables items are measured using *Dres*, *Bangchus*, *Plates* and *in bundles*. Some of the items are transacted in terms of numbers. In the urban areas the vegetable items are measured in SI unit except for leafy and dried vegetables. The differences observed in terms of the sizes of bundles from rural to urban within each Dzongkhag did not show large gaps in weights. The differences in weights observed are as low as 50 grams or less. Since the variation of weight is minimal the average weight at Dzongkhag level could be treated as a reliable estimate. Also since the survey was conducted during the dry season the items reported are mostly available in winter and the result indicated that the vegetable varieties reported are less. Special items of dried vegetables like turnip and radish leaves has been denoted as dried leafy vegetable in the table. The weight of the cane shoot is the average weight of three sticks of similar length but different sizes. However, the local unit has been referred as number and not stick.

Since the number of items reported in blocks II to VIII were less, the result are presented under a same table heading. The number of items reported from one Dzongkhag to another differs very significantly. It could be possibly understood as the extent of the use of local units to measure those items in particular Dzongkhag and on the other hand the increasing use of SI unit for the transaction of the goods.

Block III:- Collected information on the use of local units for the transaction of fruits. As our past experiences showed that the fruits were mostly reported in terms of numbers, as a trial the survey fixed the number of fruit items to be measured. The average weight of the denoted 6 numbers of the fruits in the table is actually the average weight of 18 numbers of fruit (ie 6 largest, 6 medium and 6 smallest). Most of the dried fruits are measured with the local units like *Poto* and *Phita* in the western Dzongkhags and *Lamshu* in the Eastern part of the country.

Block IV:- Deals with the transaction of Tobacco and other related products. Measurement of a fixed number of betelnut had been collected and presented in grams. Pan leaves (local and imported) and lime are measured in *bundle* and *Potos* respectively.

Block V:- Collected information on the use local units to measure liquid items like alcohol and other beverages. Most of the local units reported are *Palang*,

Jandum and *Throchu*. The volume of the unit measured in terms of liters show some variation form one place to the other. Bangchang/Tongpa is measured in grams as this item is not exactly in liquid form.

Block VI:- Basically collected various information on the use of local units to transact items related to Meat and Dairy products. In all the Dzongkhag the local unit reported was *Tsang* and in terms of balls. Dried cheese (*Chugo*) was measured in *chusey* (containing 10 small pieces of dried cheese).

Block VII:- Collected information to transact different items on Spices by using local units. The report indicated that a majority of the transaction is carried out using similar local units used for the cereals. The local units ranged from the smallest (*Poto*) to various forms of *Dres* like *Gasekhalo*, *Chandre*, *Zobjey*, *Thimjay*, *Padre* and *Shinjey*.

Block VIII:- This block deals with the information on some miscellaneous items, which is not covered in other blocks. The local units reported under this block are similar to block VII.

The report also reveals that at several instances for a particular Dzongkhag, use of very unique local unit are recorded. Those units may be the last of its kind, which is almost getting extinct. The table numbers ranging from 24 to 41 represent the extent and different local units used for the transaction of the specified items for each identified block for every Dzongkhag.

Table 25: Shows the conversion rate of the existing different local units for measuring the specified items (for block II to Block VIII) to SI unit for Thimphu Dzongkhag.

INSTRUCTION MANUAL FOR THE SURVEY

Background

The Survey on Standardization of Quantity Units is the first of its kind to be initiated by the Central Statistical Office. The evidence from the recent pilot survey, HIES 2000 indicated that a majority of our rural population still use local units for their daily transaction. The different forms of local units, evidenced from the HIES 2000 has been listed in the questionnaire for the easy references. The data collected during the HIES 2000 survey based on the local unit has very limited use and did not allow us to further explore the possibilities of reporting the consumption pattern in quantity.

Why Measure Three Samples

Prior to the distribution of the measuring unit (Gasekhalo/Chandre) by the Ministry of Finance there were several local units being used depending on the convenience, which is still used by our rural people. On the other hand although the size of the measuring unit is same the names of the unit differ from place to place. Besides, for all the items which are reported in bundles, balls, containers and in numbers/pieces as a standard rule weights for three different sizes (smallest, medium and largest) are necessary and require to collect. In case of the liquid items three different containers with the same name will be measured. This survey is an attempt to actually standardize the names of the units along with the weights. For economic reasons the data will be collected at the geog level taking just three samples for every different commonly used local unit for each crop/items.

Vocabulary Consistency

To maintain the consistency of the vocabulary used in the questionnaire "Piece and Number", which mean the same thing has been retained as number. Read 6 numbers of apples, 6 numbers of tobacco leaves instead of piece.

Recording of the Responses

All the responses/answers should be recorded in terms of **grams** for solid items and in terms of **ml** in terms of liquid items in the questionnaire.

Others Category

For all the blocks particular space has been provided for the others, which means that the enumerators have to further try to investigate if there is any other crops/items not listed in the questionnaire and being measured in the similar manner in accordance with the listed items. For such items specify the items and the units used for the measurement.

Block 1: Cereals, cereal preparations and pulses

This block is meant for cereal and cereal preparation. In this block, if there are different types of units being used for measuring a single item, which differ in size of the measuring unit take three commonly used measuring unit and weigh the item in terms of the SI unit and record the weight in grams. For instance, take chandre; get three Chandres from three different sources and record the weights on the form the size may not be necessarily different but it is required to take the sample from different sources. Similarly in case of khaw it may either differ in size or in shape, as this is not actually supplied from one particular source, for such unit, try to measure three different units and record the weight in grams. Collect data for all the units as prescribed on the form and complete the collection for all the items listed: In case of the millet, there are two types; finger millet and foxtail millet, which can be easily identified by its colour. The former is red in colour and the latter white. Similarly, bitter and sweet buckwheat needs to be measured separately, which is known as Jho and Garay in Dzongkha. Although there are three different types of Zaws, namely Ngoza, Shunza and Baga you are required to mix the three in equal proportion and get the weight. It may be difficult but is very much required.

Block 2: Vegetables

This block deals with Vegetables (fresh and dried). In this block most of the items would be reported in terms of bundles, numbers and other non

standard containers like plates, bangchu etc. For the items, which are commonly transacted as bundles; it is required to take three different sized bundles for the particular item and weigh it. For those items, which are reported in numbers/sticks, specific numbers/sticks are indicated to measure. The measurement for three different sizes will have to be reported. Similarly for the other non standard container locate three different sizes and get the weight. Under this block special attention has to be paid while trying to get the measuring unit for weighing Garlic head. Possibilities of the units used are given on the form.

Block 3: Fruits

This block relates to Fruits (fresh and Dried). The items are reported in terms of Numbers. A standard count of number of the items listed needs to be weighed. In case of the sugarcane get the weight for 3 different nodal lengths. For the convenience of the data collector most of the item numbers to be measured are fixed at 6 numbers. For example 6 apples needs to be weighed for three times that is first select 6 numbers of smallest sized apples, then 6 medium sized apples and the 6 largest sized apples. Record the weights on the space provided.

Block 4: Tobacco and other products

This block relates to Tobacco and Other products. All those manufacture items, which come with the net weight on the packet, have been excluded. Specific items, which may be reported in terms of number, should be weighed as in block 3.

Block 5: Oil, Alcohol and other beverages

This block is for any form of liquid. Non standard container, which is used for the transaction of liquids should be measured and record the answers in ml. Bottle and plastic jerrins of any type and sizes, which have prescribed net weight has not be included for the survey. More attention has been placed on the containers, which are locally made like palang, dop, throchu etc.

Block 6: Dairy products and meat

This block is for dairy products. The various units for measuring butter could be tsang and pori in western region, phok in the east and ser in the southern region. The unit for cheese and egg can be in ball and numbers respectively. In the case of meat, the unit can be in tsang, pori, phok, ser, bundle and Goe. Take the defined sample and record the responses in grams. The exercise is similar to Block 1 and 2. Dry cheese are sold in the form of chu-shey. You should weigh the chu-shey and write the conversion rate in the given space.

Block 7: Spices

This block is meant for spices. The unit for fresh and dry chillies (local) can be in all forms of dres, bangchu, plates and phitas. Repeat similar exercise as in Block 1.

Block 8: Miscellaneous

This block is particularly for the religious items such as tsangzay powder. The possible measurement units in use would be in all types of Dres, Bangchu, plates and phitas. Carry out similar standard sample to actually get the weights.
